

SEAT BARI

The BARI model is a one-piece backless seat, featuring numerous transverse and longitudinal reinforcement ribs that ensure quality and robustness. The seat is constructed with a closed double box-type wall, offering maximum resistance to vandalism. Its ergonomic design provides high comfort and automatic liquid drainage without the need for holes, thus preventing dirt accumulation.

The BARI seat is certified to the highest market standards and complies with Minimum Environmental Criteria (CAM), meeting European Standards EN 13200-1-4. It has been laboratory-tested in accordance with European Standard EN 12727:2017 (level 4 – severe).

Made from top-quality injection-molded polypropylene copolymer, it is also available in an eco-friendly version using recycled polypropylene from post-consumer or industrial waste (PSV), certified by IPPR. A polyamide version is also available.

The seat is fire-retardant in compliance with current regulations and UV-resistant thanks to specific additives. It is equipped with a visible, tamper-proof, numbered tag that can be customized to meet client requirements.

Its smooth and uniform surface makes cleaning easy. Mounting is done with 2 or 4 anchoring points, sealed and protected by non-removable caps in the same color as the seat.
